Fire Alarm Systems

Fire alarm systems are the first line of defense to alert building occupants when there is a fire emergency. All building fire alarm systems on FSU campus are monitored by FSUPD.

Fire alarm systems can be manually activated by a fire alarm pull station or initiated by detection devices.

Automatic fire alarm systems can have heat detectors, smoke detectors, carbon monoxide detectors, or combination detectors.

Fire alarm systems that are located in building with automatic sprinkler systems can be activated by flow switches when water is flowing through a sprinkler head.
