

## Industrial Hygiene Training

The purpose of Industrial Hygiene Training Program is to provide safety training relative to the specific tasks and procedures that university employees perform to accomplish their daily work assignments. In addition, this program serves to ensure that university operations and work-related activities are conducted in compliance with applicable regulatory requirements.

The objectives of the Industrial Hygiene training program are to reduce the potential for work related accidents and unsafe practices by university employees that result in injuries, illness, or creation of a hazardous work environment, to maintain compliance with all relevant regulatory requirements, and to minimize the University's liability due to accidents, injuries, and work related illness.

The Industrial Hygiene Office is responsible for programs covered by the Occupational Health and Safety Administration's General and Construction Industry Standards. Contained within those standards are specific training requirements related to work activities performed by University employees.

When conducting day to day work related activities it is important to maintain awareness of and strict adherence to safety practices appropriate to the tools, equipment, and general work activities being conducted. Consequently, all personnel working with any potentially hazardous tools, equipment or materials, or performing potentially hazardous work activities must receive appropriate training provided by EH&S and/or the responsible department supervisor, or an alternative subject matter expert. EH&S will provide general information regarding safe use of tools, equipment, and materials, and the safe way to conduct potentially hazardous work activities.
